

# What if you could predict the future?

## INFRARED THERMAL IMAGING MAKES IT POSSIBLE

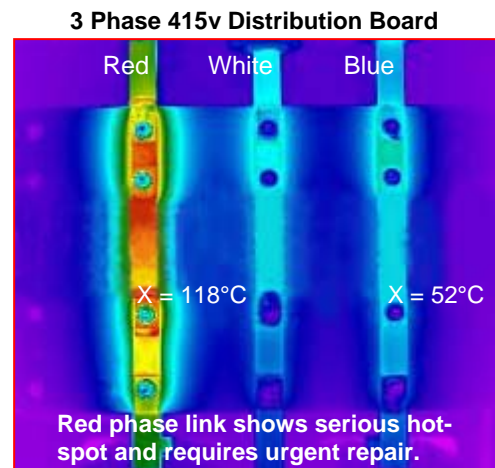

Across every industry, businesses of all sizes are increasingly benefiting from an infrared thermographic inspection to:

- Reduce the risk of an unexpected and costly interruption to operations.
- Provide peace of mind from confidence in the safety and reliability of electrical systems, plant and machinery.

With no down time to operations, thermal imaging quickly and easily locates problems before they become serious, such as:

- Overloaded or unbalanced circuits
- Potential fire risks
- High resistance terminations
- Faulty devices

Clients are then able to schedule and carry out repairs according to their priorities.

Driven by Maintenance Management, Insurance Risk Management, O H & S issues, and Quality/Standards Accreditation Programmes, infrared thermographic inspections apply to all electrical infrastructures, both high and low voltage:

- Switch Boards
- Mechanical Services Switch Boards
- Machine Control Centres

A regular thermographic inspection contributes to the bottom line by:

- Avoiding the costs of an electrical failure that could have been detected
- Improving electrical system safety and reliability
